New records of Neotropical Cassidinae, with description of three
new species
(Coleoptera: Chrysomelidae)

LECH BOROWIEC

Zoological Institute, University of Wrocław, Sienkiewicza 21, 50-335 Wrocław, Poland, e-mail:
cassidae@biol.uni.wroc.pl

ABSTRACT. Faunistic records of 427 Neotropical species of Cassidinae are given from Brazil (151 species), Argentina (82), Peru (74), Venezuela (62), Paraguay (61), Bolivia (48), Ecuador (41), Mexico (37), Colombia (35), Costa Rica (31), French Guyana (23), Surinam (20), Panama (16), Nicaragua (10), Uruguay (5), Guatemala (4), Guyana (3), Honduras (3), Belize (2), Cuba (2), Chile (1), and Puerto Rico (1). Three new species are described: *Charidotella bordoni* (Venezuela), *Hilarocassis bordoni* (Venezuela), and *Paraselenis saltaensis* (Argentina, Paraguay). *Paraselenis filia* is removed from synonyms of *P. hyalina*, *P. hyalina* ssp. *suspecta* is raised to the species rank. The specific status of *Chelymorpha andicola* SPAETH is confirmed.

Key words: entomology, taxonomy, zoogeography, Coleoptera, Chrysomelidae, Cassidinae, new records, Neotropical Region.

INTRODUCTION

This paper is the second faunistic contribution to the knowledge of Neotropical Cassidinae. In the first contribution I recorded 719 species (BOROWIEC 1996). Like in my previous paper (BOROWIEC 1996) I treat Cassidinae in a traditional way, i.e. including all the genera listed by HINCKS (1952).

The list includes 427 species recorded from Brazil (151), Argentina (83), Peru (74), Venezuela (62), Paraguay (61), Bolivia (48), Ecuador (41), Mexico (37), Colombia (35), Costa Rica (31), French Guyana (23), Surinam (20), Panama (16), Nicaragua (10), Uruguay (5), Guatemala (4), Guyana (3), Honduras (3), Belize (2), Cuba (2), Chile (1), and Puerto Rico (1); 127 new country records are given.

Three new species are described: *Charidotella bordoni* (Venezuela), *Hilarocassis bordoni* (Venezuela), and *Paraselenis saltaensis* (Argentina). *Paraselenis filia* SPAETH, 1907 is removed from synonyms of *P. hyalina* (BOH.) and redescribed. *Paraselenis hyalina* ssp. *suspecta* SPAETH is raised to the species rank. The specific status of *Chelymormpha andicola* SPAETH is confirmed.

The nomenclature used follows my catalogue (BOROWIEC 1999); because in the catalogue all references to species descriptions and synonyms have been cited, they are not included in this paper.

MATERIALS

The following collections, with abbreviations used in the text, have been studied:

CCH - coll. C. CHABOO, New York, USA;
 DS – coll. D. SASSI, Castelmarte, Italy;
 FF – coll. F. FRITZLAR, Jena, Germany;
 FK - coll. Frantisek KANTNER, Lipi, Czech Republic;
 HNHM – Hungarian Natural History Museum, Budapest, Hungary (O. MERKL);
 JB – coll. J. BEZDEK, Brno, Czech Republic;
 KL – coll. K. ŁOŚ, Warsaw, Poland;
 MB – coll. M. BERGEAL, Versailles, France;
 ML - M. LANGER, Lichtenwalde, Germany;
 MO - coll. M. OUDA, Plasy, Czech Republic;
 MRSNT - Museo Regionale di Storia Naturale, Torino, Italy (M. DACCORDI)
 MS - coll. M. SNIZEK, České Budejovice, Czech Republic;
 MZ - coll. M. ZUBER, Kosmonosy, Czech Republic;
 PK - coll. P. KRÓL, Warsaw, Poland;
 RB - coll. R. BEENEN, Nieuwegein, the Netherlands;
 RGS – coll. Mus. Rio Grande do Sul, Porto Alegre, (M.H.M. GALILEO);
 SEM – Snow Entomological Museum, Lawrence, USA;
 TAU – Tel Aviv University (A. FREIDBERG);
 UH – coll. U. HEINIG, Berlin, Germany;
 ZMHU – Zoologisches Museum, Humboldt Universität, Berlin, Germany (M. UHLIG).

ACKNOWLEDGEMENTS

I would like to express my thanks to all curators and collectors listed above for the loan of the specimens. Special thanks go to D. SASSI (Castelmarte, Italy) for his help in arrangement of the Carlos BORDÓN collection. I would also like to thank Dr. J. ŚWIĘTOJAŃSKA (Wrocław University) for the line drawings.

LIST OF SPECIES

***Acromis sparsa* (BOHEMAN, 1854)**

PERU: Loreto, Pucalipa, 3 IX 1979, 1 (SMNS).

VENEZUELA: Portuguesa, Biscucuy, 500 m, 3 IX 1985, 1, 21 VI 1993, 1, BORDÓN (MRSNT).

DISTRIBUTION: Bolivia; Brazil; Colombia; Costa Rica; S Mexico; Nicaragua; Panama; Peru; Venezuela.

***Acromis spinifex* (LINNAEUS, 1763)**

BOLIVIA: Beni, Rurrerabaque env., 18-21 XI 1998, 6, S. POKORNY & V. TICHY (FK, MO, MS); Ruranabaque, VII 1982, 1, F. SCHRAMM (SMN).

BRAZIL: Espirito Santo, Serra do Caparao, VI 1934, 1, D. KNUDSEN (NRS); Goias, Brasilia-Belo Horizonte km 50, 15 XI 1983, 2, BORDÓN (MRSNT); Goias, Goiania, XII 1975, 1, GALANI (LB); Sao Paulo, Est. Ecol. Juréia Itat.-Peruibe, 17-21 III 1997, 2, A. BRESCOVIT (RGS).

PARAGUAY: Central Prov., Asuncion, Ybycui Nat. Park, 28-31 I 2001, 2, MRACEK (MS).

DISTRIBUTION: N Argentina; Bolivia; Brazil; Colombia; Ecuador; French Guyana; Guyana; Paraguay; Peru; Surinam; Trinidad and Tobago; Venezuela.

***Agenysa boliviana* SPAETH, 1915**

BOLIVIA: Cochabamba, Chapare, 400 m, IX 1953, 1 (MS).

DISTRIBUTION: Bolivia: Cochabamba, Chapare, Chiquitos, El Palmar, La Paz, Las Juntas, Mapi, Pando, Rio Bopi, Rio Japacani, San Antonio, Santa Cruz, Yungas del Palmar.

***Agenysa caedemadens* (LICHTENSTEIN, 1795)**

SURINAM: Commewijne, Peperpot, 28 XI 1961, 1, K.U. KRAMER (RB).

DISTRIBUTION: Bolivia: Santa Cruz; French Guyana: Bas Maroni, Cayenne, Kourou, St. Laurent; Peru: Yurimaguas; Surinam: Benede Nic Kerie, Paramaribo, Saramaca, Tapanohoni; Brazil: Amazonas, Bahia, Mato Grosso, Pará, Rio de Janeiro, Rio Grande do Sul, Rondonia, Terr. de Acre, Terr. do Amapa, Terr. de Guapore; Venezuela.

***Agenysa connectens* (BALY, 1869)**

PERU: Loreto, Putumayo valley, IV 1977, 1 (SMNS); Pasco, Villa Rica, I 1995, 1, KONDLER (LB).

DISTRIBUTION: Brazil: Rondonia; Colombia: Huila, Rio Negro; Ecuador: Moronasantiago, Napo, Pastaza, Pichincha; Panama: Cana Gold Mine; Peru: Chanchamajo, Huanuco, Huallaga, Junin, Loreto, Montenegro, Pachitea.

***Agenysa crassicornis* SPAETH, 1905**

ECUADOR: Mts. Condijua, 2500 m, 3-16 II 1997, 1, HRDY (MS); Pastaza, Santa Clara, 25-28 I 2000, 1, Z. MRACEK (MS).

DISTRIBUTION: NW Brazil; Colombia: Umbria, Guines Fluss; Ecuador: Napo.

COMMENTS: its specific status is doubtful, may be it is only dark, unicolours form of *A. connectens* (BALY).

***Agenysa guianiensis* (BOHEMAN, 1856)**

SURINAM: Commewijne, Peperpot, 28 XI 1961, 1, K.U. KRAMER (RB).

DISTRIBUTION: Antilles: Curaçao Is.; Argentina: Salta; Brazil: Amazonas, Mato Grosso, Pará, Sao Paulo; Guyana: Rio Maroni; Surinam: Afobaka, Benede Nie Keru, Paramaribo, SARAMACCA; Venezuela: Bolivar, Delta Amacuro, Subre.

***Agenysa parellina* (BOHEMAN, 1850)**

ARGENTINA: Misiones, NP Iguazu, 2 X 1994, 1, T. GÜNTHER (FF).

DISTRIBUTION: Argentina: Chaco, Corrientes, Entre Rios, Misiones; Brazil: Mato Grosso, Rio Grande do Sul, Sao Paulo; Paraguay: Buena Vista, Col. Thomson, Peribebuy; Uruguay: Arroyo Mandiyu, Artigas, Maldonado, San Gregorio.

***Agenysa peruviana* SPAETH, 1915**

ARGENTINA: Misiones, El Soberbio, XII 1987, 1 (DS).

PERU: Madre de Dios, Manu, Erika near Salvacion, 550 m., 5-6 IX 1988, 1, A. FREIDBERG (TAU); Madre de Dios, Rio Alto Madre de Dios Salvation, Manu Park, 600-700 m, 5 VII 1999, 1 (ML).

DISTRIBUTION: Bolivia: Yungas de la Paz; Peru: Amazonas, Chanchamayo, Cuzco, Huanuco, Iquitos, Junin, Loreto, Madre de Dios, Marcapata, Pachitea, Paucartambo, Puno, Rio Huallaga, Satipo, Sivia, Tingo Maria. New to Argentina.

***Agroiconota bivittata* (SAY, 1827)**

MEXICO: Mexico, Ixtapan del Oro, VI 1992, 1, S. POKORNY (MO).

DISTRIBUTION: Mexico: Guerrero, Sinaloa; C and S USA.

***Agroiconota conflagrata* (BOHEMAN, 1855)**

BRAZIL: Mato Grosso do Sul, Bonito, 27 XI 2000, 1, A. KUDRNA (MO); Mato Grosso do Sul, 70 km SW Nova Andradina, 18-25 XI 2000, 1, A. KUDRNA (MO).

PERU: Las Aquitias, VII 1992, 1 (DS); Ucayali, Pucalpa, VII 1992, 1 (DS).

SURINAM: Paramaribo, Paramaribo, 9 III 1908, 1, C. HELLER (ZMHU).

DISTRIBUTION: Brazil: Amazonas, Mato Grosso, Pará; Cuba; Ecuador: Napo; French Guyana: Kourou; Surinam: Paramaribo; Trinidad. New to Peru.

***Agroiconota inedita* (BOHEMAN, 1855)**

ARGENTINA: Salta, Campo Quijano, 1600 m, 1-17 II 1984, 4, BORDÓN (MRSNT).

BRAZIL: Santa Catarina, Nova Teutonia, XI 1938, 1, F. PLAUMANN (NRS).

DISTRIBUTION: Argentina: Misiones; Brazil: Mato Grosso, Minas Gerais, Pará, Paraná, Pernambuco, Rio de Janeiro, Santa Catarina, Sao Paulo, Paraguay: Asuncion, Puerto P. Stroessner.

***Agroiconota judaica* (FABRICIUS, 1781)**

BRAZIL: Amapa, Curua, Valle Rio Jari, 20-30 XI 1983, 14, C. TASURASO (SMNS, LB).

COLOMBIA: Cesar, San Alberto, VIII 1984, 3, Ph. GENTY (LB, MB).

ECUADOR: Los Rios, Quevedo, Pichilingue, 100 m, VIII 1974, 3, BORDÓN (MRSNT).

SALAZAR (UCE); Pastaza, Rio Puyo, Cotococha, 1000 m., 1.32.4 S 77.53.6 W, 24 I 1998, 1, L. NADAI (HNHM).

FRENCH GUYANA: Fourgassie, 13-17 XI 1995, 1, M. SNIZEK (MS); Le Larivot, 3-6 XI 1995, 1, M. SNIZEK (MS).

PERU: Huanuco, Tingo Maria, 13 VIII 1986, 1, J.K. WINKELMANN (RB).

DISTRIBUTION: Brazil; Colombia; Ecuador; French Guyana; Guyana; Peru; Venezuela.

***Aslamidium impurum* (BOHEMAN, 1850)**

COSTA RICA: Puntarenas, Monte Verde, 1400 m, 13 V 1989, 1, ASHE, BROOKS & LESHEN (SEM).

DISTRIBUTION: Brazil; Colombia; Costa Rica; Guatemala; Mexico; Nicaragua; Panama.

***Aslamidium semicirculare* (OLIVIER, 1808)**

COLOMBIA: Cesar, San Alberto, II 1979, 15, on *Heliconia*, Ph. GENTY (LB, MB).

ECUADOR: Esmeraldas, Mayronga, 100 m, 25 X 1993, 2, G. ONORE (MZUF); Los Rios, Quevedo, Pichilingue, 100 m, VIII 1974, 1, BORDÓN (MRSNT); Pichincha, via Calacali La Indep. km 165, 290 m, 21 II 1996, 1, T. LOZADA (UCE).

PANAMA: Panama, Cerro Campana, 1 IV 1967, 2, DRESSLER (MRSNT).

DISTRIBUTION: Colombia; Ecuador; French Guyana; Panama.

COMMENTS: Ecuadorian specimens are well characterized by their mostly black elytral disc without yellow pattern. Perhaps they represent a new species or distinct geographic form.

***Botanochara angulata* (GERMAR, 1824)**

ARGENTINA: Buenos Aires, Olivos, 1 (DS).

BRAZIL: Santa Catarina, Nova Teutonia, XI 1975, 1 (SMNS).

DISTRIBUTION: Argentina: Buenos Aires, Cordoba, La Pampa, Pico, Salta, San Pedro; S Brazil: Parana, Rio Grande do Sul, Santa Catarina; Paraguay; Uruguay: Canelones, Las Piedras.

***Botanochara bonariensis* (BOHEMAN, 1850)**

BRAZIL: Rio Grande do Sul, Sarra Azul, I 1931, 1, P. BUCK (SMN).

DISTRIBUTION: Argentina: Buenos Ayres, Misiones, Rio de la Plata; Brazil: Rio Grande do Sul; Paraguay; Uruguay.

***Botanochara cancellata* (BOHEMAN, 1850)**

ARGENTINA: Cordoba, Capilla del Monte, 1000 m, 31 I 1981, 2, BORDÓN (MRSNT); Salta, Alemania, II 1992, 1 (DS); Tucuman, Colalao del Valle, 20 I 1993, 1, R. FÖRSTER (ML).

DISTRIBUTION: Argentina: Buenos Ayres, Catamarca, Cordoba, Salta, Tucuman; Brazil: Entre Rios, Parana, Santa Catarina.

***Botanochara convexiuscula* (SPAETH, 1922)**

PERU: Cusco, Rio Urubamba, 700 m., Koribeni, 15 XI 1994, 1, T. HACZ & G. HOLZINGER (HNHM); Junin, Satipo, 1993, 1 (MO).

DISTRIBUTION: Bolivia: Sierra Corroico; Peru: Madre de Dios, Vilcanota.

***Botanochara decempustulata* (BOHEMAN, 1850)**

ARGENTINA: Cordoba, Capilla del Monte, 1000 m, 31 I 1981, 2, 6-12 I 1984, 3, BORDÓN (MRSNT); Cordoba, Dto. Punillo, Charbonier, IV 1971, 2, MARTINEZ (MRSNT); Cordoba, La Cumbre, III 1975, 2, NIEVES (MRSNT); Salta, II 1993, 1 (DS); Salta, Güemes-Salta km 15, 800 m, 22 I 1984, 1, BORDÓN (MRSNT).

DISTRIBUTION: Argentina: Buenos Ayres, Catamarca, Cordoba, Entre Rios, Tucuman; Bolivia: Santa Cruz.

***Botanochara decemverrucata* (BOHEMAN, 1850)**

BOLIVIA: Beni, Rurrerabaque env., XI 1998, 1, S. POKORNY (MO); Beni, Guanay, X 1992, 1 (DS).

DISTRIBUTION: Argentina: Catamarca, Tucuman; Bolivia: Villa Montes; Brazil: Mato Grosso, Chile: Santiago; Parana; Paraguay: Rio Apia, Salta.

***Botanochara duodecimnotata* (BOHEMAN, 1850)**

PARAGUAY: Chaco, M. Estigarribia, 10-22 I 1990 (DS).

DISTRIBUTION: Brazil: Mato Grosso; Paraguay: Chaco.

***Botanochara duodecimverrucata* (BOHEMAN, 1850)**

ARGENTINA: Cordoba, Punillo, Charbonier, IV 1971, 9, MARTINEZ (MRSNT, LB); Cordoba, Sierra Cordoba, Capilla d. M., 1000 m, 31 I 1981, 1, 6-12 I 1984, 1, BORDÓN (MRSNT); Cordoba, Pampa, Cosquin, II 1985, 2, R. FÖRSTER (ML).

URUGUAY: Lavalleja, Minas, XI 1983, 17, W.D. ROVERA (HNHM, LM).

DISTRIBUTION: Argentina: Buenos Ayres, Catamarca, Cordoba, Salta, Tucuman; S Brazil; Uruguay.

S. Luis, Hueque, 11 X 1971, 1, BORDÓN (MRSNT); Miranda, Caucagua, 25 VII 1987, 2, BORDÓN (MRSNT); Miranda, Cortada de Maturin, 800 m, 13 VIII 1967, 1, BORDÓN (MRSNT); Miranda, Guarenas, Curupao, 450 m, 10 VI 1962, 1, BORDÓN (MRSNT); Miranda, Rio Chico, 10 VI 1987, 1, 19 VI 1987, 1, 27 VII 1987, 2, BORDÓN (MRSNT, LB); Miranda, Virongo, Curiepe, 200 m, 23 VI 1968, 1, BORDÓN (MRSNT); Portuguesa, Biscucuy, 800 m, 26 VII 1967, 1, BORDÓN (MRSNT); Yaracuy, Aroa, 500 m, 16 VIII 1985, 1, BORDÓN (MRSNT); Zulia, El Tucuco, Machiques, 400 m, 22 XI 1984, 2, BORDÓN (MRSNT, LB).

DISTRIBUTION: Colombia; Costa Rica; Panama; Venezuela. New to Surinam.

***Chelymorpha andicola* SPAETH, 1928 *bona* sp.**

Chelymorpha andicola SPAETH, 1928: 44.

Chelymorpha andicola ab. *aequatorinesis* SPAETH, 1928: 44.

Chelymorpha constellata ssp. *andicola*: SPAETH, 1942: 30.

ECUADOR: Pastaza, Rio Puyo, Cotococha, 1000 m., 1.32.4 S 77.53.6 W, 24 I 1998, 1, L. NADAI (HNHM).

DISTRIBUTION: Ecuador; Peru.

COMMENTS: SPAETH (1928) described *Chelymorpha andicola* from Peru with an aberration ab. *aequatoriensis* from Ecuador. Later SPAETH (1942) reduced *Ch. andicola* to the subspecies of *Ch. constellata* (KLUG). Although both taxa are very similar, they differ distinctly in the structure of spermatheca. Thus I have restored the species rank to *Ch. andicola* Sp.

***Chelymorpha areata* (ERICHSON, 1847)**

ARGENTINA: Buenos Ayres, XI 1932, 1, I. VASOO (DS); Cordoba, Sierra Cordoba, Capilla d. DESCRIPTIONS AND REDESCRIPTIONS

***Charidotella* (s. str.) *bordoni* n. sp.**

ETYMOLOGY

Dedicated to Carlos BORDÓN, who collected this species.

DIAGNOSIS

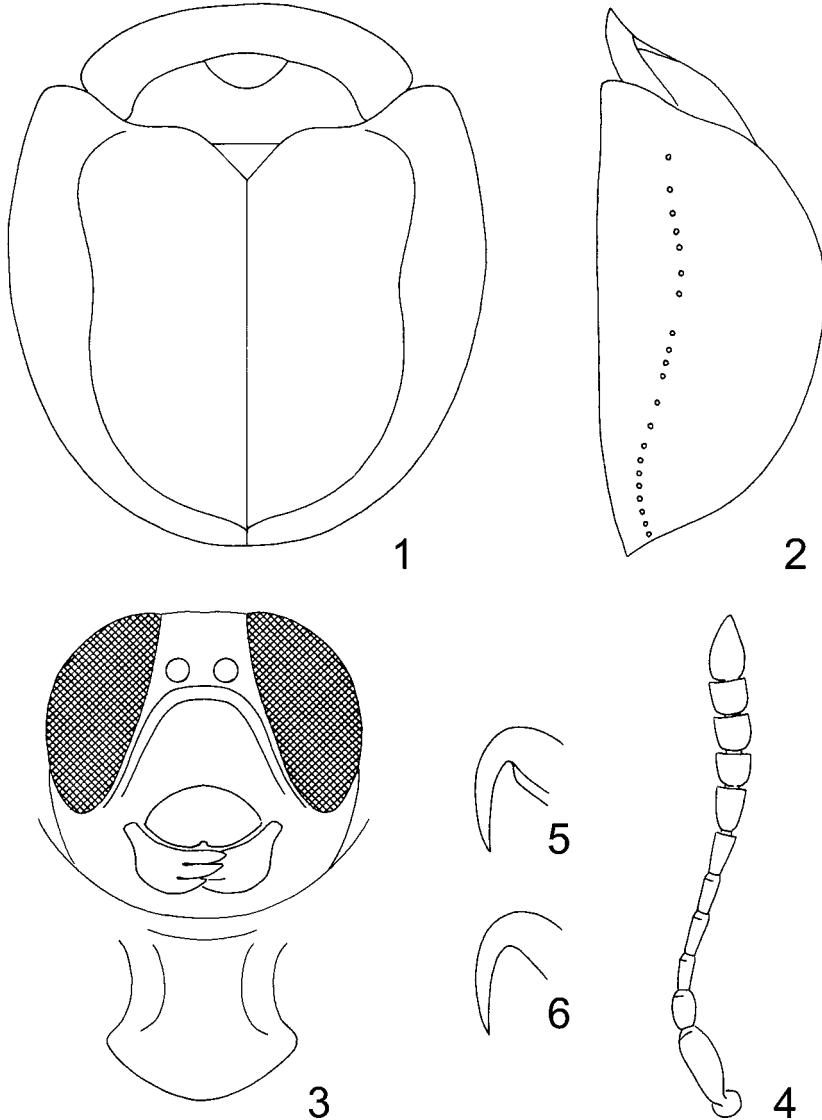

Ch. bordoni belongs to the group of species with more or less regularly convex elytral disc, elytral integument without pattern on either dorsal or ventral surface, and ventrites uniformly yellow. The group comprises also *Ch. limpida* (BOH.), *Ch. immaculata* (OL.), and *Ch. pallescens* (BOH.). *Ch. limpida* and *Ch. immaculata* (in both species ventrites vary from uniformly yellow to partly black) differ distinctly in flat clypeus flat, without elevated borders, at most in the middle with shallow impression, while in *Ch. pallescens* and *Ch. bordoni* clypeal plate in anterior part has elevated border, thus anterior part of clypeus appears distinctly impressed. *Ch. bordoni* differs in less and more regularly convex elytral disc (in *Ch. pallescens* elytral disc is slightly gibbous in postscutellar point), finer elytral puncturation, especially in anterolateral part of disc, and less angulate humeral angles.

DESCRIPTION

Length: 5.6-6.4 mm, width: 4.9-5.8 mm, length of pronotum: 1.95-2.2 mm, width of pronotum: 3.4-3.8 mm, length/width ratio: 1.09-1.19, width/length of pronotum ratio: 1.73-1.79. Body almost circular (fig. 1).

Pronotum, elytra, clypeus, ventrites, and legs, uniformly pale yellow. Antennal segments 1-6 pale yellow, segments 7-11 slightly darker yellow. No dark spots on underside of elytral disc.

Pronotum elliptical, the widest in mid length, sides slightly irregularly rounded with very subtly marked basal angles. Disc moderately convex, indistinctly bordered from explanate margin, impunctate, smooth and shiny. Explanate margin with honeycomb structure, its surface impunctate, smooth and shiny.

1-6. *Charidotella bordoni*: 1 – dorsal, 2 – lateral, 3 – head and prosternum, 4 – antenna, 5 – female claws, 6 – external claw of mid tarsi of male

Scutellum triangular, impunctate, without sulci, its surface smooth and shiny. Base of elytra distinctly wider than pronotum, humeri moderately protruding anterad, margin of elytra behind humeral angle not emarginate, angles subangulate (fig. 1). Anterior margin of elytron smooth. Elytral disc regularly convex with top of convexity in postscutellar area (fig. 2). No postscutellar and lateral impressions. Principal impression shallow, well visible. Puncturation regular, very fine, in posterolateral area and in principal impression punctures only slightly coarser than in sutural half of disc. On slope punctures very sparse, thus large part of slope looks almost impunctate. Intervals many times wider than rows, flat, smooth and shiny. Marginal row distinct, its punctures twice coarser than punctures of submarginal row. Explanate margin broad, in the widest part slightly wider than half width of each elytron, its surface smooth and shiny. Apex of elytral epipleura glabrous.

Clypeus broad, c. 1.7 times as wide as long. Clypeal grooves fine but distinct, converging in arch. Borders of clypeal plate distinctly elevated, especially in anterior part of clypeus, thus the clypeal plate in anterior half appears slightly impressed. Labrum moderately broad, with very shallow median emargination. Prosternal process broad, only slightly explanate apically, sides slightly elevated, central plate smooth and shiny (fig. 3).

Antennae slim, segments 8-10 as wide as long, length ratio of antennal segments: 100:46:43:53:46:53:56:40:46:43:87, segment 3 slightly shorter, segment 4 c. 1.2 times as long as than segment 2 (fig. 4).

All claws in female with small basal teeth (fig. 5), in male external claw of mid tarsi simple (fig. 6).

TYPE MATERIAL

VENEZUELA: holotype: "Las Rosas, 900 m., Canoabo: Bejuma" "Edo. Carab. VENEZ., Bordón 16 VII 983"; 4 paratypes: the same data (holotype preserved at the Museo Regionale di Storia Naturale, Torino, Italy, paratypes at the Museo Regionale di Storia Naturale, Torino, Italy and Department of Systematic Zoology and Zoogeography, Wrocław University, Wrocław, Poland).

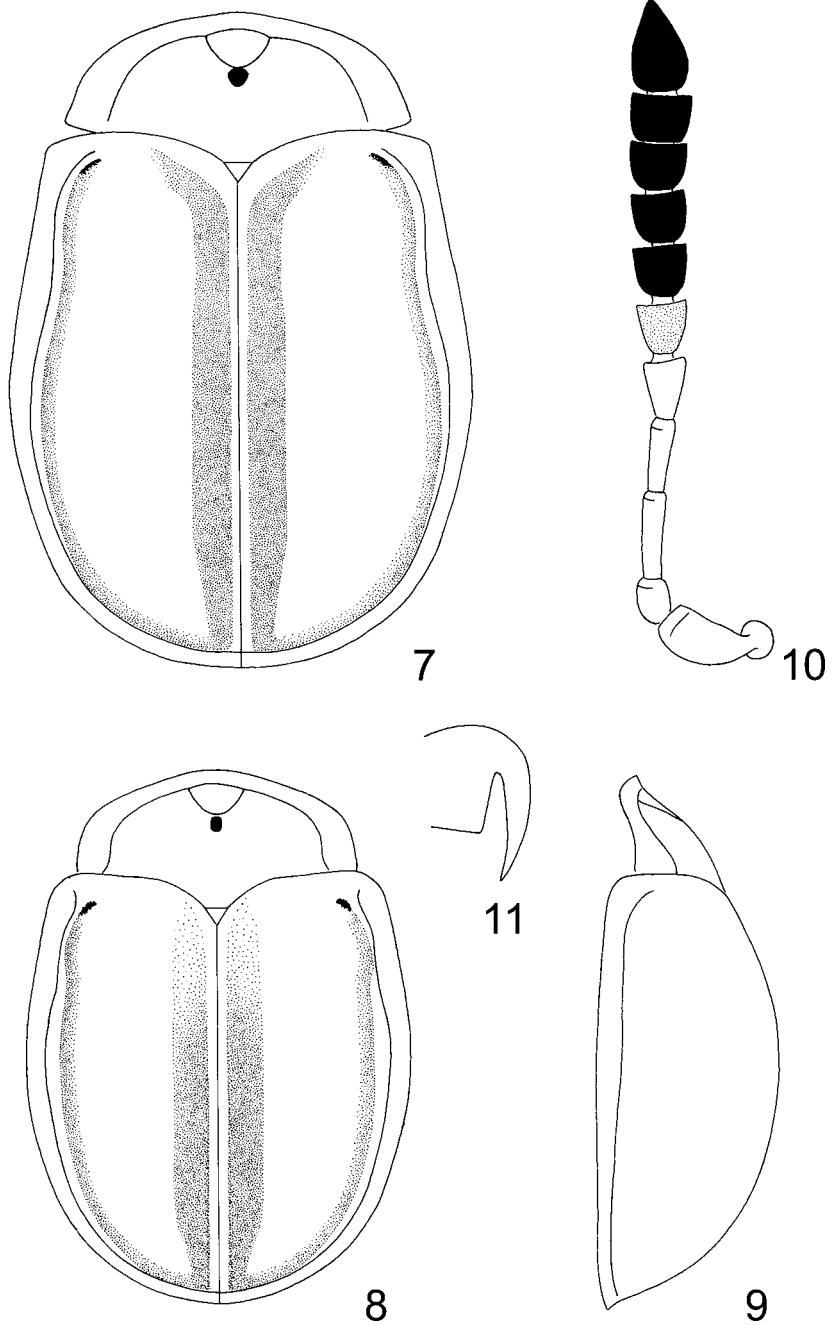

Hilarocassis bordoni n. sp.

ETYMOLOGY

Dedicated to Carlos BORDÓN, who collected this species.

DIAGNOSIS

The genus *Hilarocassis* Sp. comprises 8 species distributed from Mexico to N Argentina. It can be subdivided into two distinct groups. The first group is characterized by deep antennal groove bordered externally by a sharp carina. The group comprises *H. rubripennis* Sp., *H. nigritarsis* (Boh.), and *H. venusta* (Boh.).

7-11. *Hilarocassis bordoni*: 7 – female dorsal, 8 – male dorsal, 9 – male lateral, 10 – antenna, 11 – claw

The second group is characterized by absent or very shallow antennal groove bordered externally only by a fold. The group comprises the remaining 5 species and *H. bordoni* n. sp. *H. evanida* (BOH.) and *H. suturella* (BOH.) are distinguished by immaculate pronotum, while in the remaining four species pronotum is black marked. *H. quinquelineata* Sp. is distinct in having pronotum with longitudinal median black line, while in the remaining three species in the middle of pronotum there is a small, black spot. *H. exclamationis* (L.) differs distinctly in the upper surface of elytral disc with black narrow line along each side, while in *H. albida* (GERM.) and *H. bordoni* n. sp. the elytral disc is dorsally without black lines, at most with small black spot at humeral callus and in posterior part of each elytron. *H. albida* differs in the presence of two small, round black spots on dorsal side of each elytron (posterior spot occasionally obsolete), one on humeral callus and one in posterior part of elytra, while in *H. bordoni* the dorsal part of elytra is without spots or only on humerus there is an irregular black marking. Black bands surrounding underside of elytral disc in *H. albida* are indistinct or completely invisible, while in *H. bordoni* they are well visible through partly transparent elytral integument (similar as in *H. exclamationis*). Scutellum in *H. albida* is usually black, while in *H. bordoni* it is yellowish brown to brown.

DESCRIPTION

Length: male 7.35-7.7 mm, female 8.9-9.5 mm, width: male 5.2-5.3 mm female 5.6-6.2 mm, length of pronotum: male 2.3 mm female 2.35-2.7 mm, width of pronotum: male 3.95-4.1 mm female 4.2-4.7 mm, length/width ratio: male 1.39-1.48 female 1.51-1.59, width/length of pronotum ratio: 1.72-1.79. Body elongate-oval, males distinctly smaller and stouter than females (figs 7, 8).

Pronotum rusty yellow, in the middle with small, round, black spot. Scutellum rusty yellow, or pale to dark brown in the middle but never black. Anterior margin of elytra rusty yellow or only in the middle with black line. Elytral disc yellow, without spots, or only humeral calli with very small, irregular black spot. Ventral side of elytron with black band surrounding disc, the black markings well visible from above through partly transparent elytral integument. Explanate margin yellow, the same colour as elytral disc, or rusty yellow, the same colour as pronotum. Head, ventrites, and legs yellow. Antennal segments 1-5 yellow, segment 6 yellow ventrally, brown to black dorsally, segments 7-11 black, ventral side of segment 7 in some specimens brown, and apical part of ventral side of segment 11 rusty to brown.

Pronotum transverse, the widest at base, sides in basal half in female slightly more converging anterad than in male, anterior margin stright, head not visible from above. Disc moderately convex, sides shallowly impressed. Central part of disc with very shallow, fine and sparse punctures, distance between punctures few times wider than puncture diameter. Interspaces slightly dull. Explanate margin narrow, well bordered from disc, surface slightly dull and finely, sparsely punctate.

Base of elytra moderately wider than base of pronotum. Disc regularly convex, moderately coarse, completely irregularly punctate (fig. 9). Distance between punctures 2-3 times wider than puncture diameter. Interspaces smooth and slightly shiny. No marginal row, but in anterior third of disc there is more or less visible impunctate marginal interval, in some specimens the impunctate area slightly elevated. Explanate margin very narrow, punctate as sparse as but slightly finer than on disc.

Ventrites with no specific characters. Antennae stout, segments 9 and 10 transverse, length ratio of antennal segments: 100:53:100:81:68:62:56:56:53:53:112 (fig. 10). Claws with large basal tooth (fig. 11).

TYPE MATERIAL

VENEZUELA: holotype: "GÜIRIA, m. 100, Rio Manacal, EDO: SUCRE" "3-8 I 1967 Bordón leg."; paratype: "P. Nac. Rancho Grande, m. 1200 (Edo. Aragua); "14-V.1967, Bordón leg."; 3 paratypes: "Chichiriviche, Littoral (D. F.)" "VENEZ. Bordón, 14 VIII 87"; paratype: "Chichiriviche, S. Miguel, 500 m." "(D. FED.) VENEZ., Bordón, 19 VIII 85" (holotype preserved at the Museo Regionale di Storia Naturale, Torino, Italy, paratypes at the Museo Regionale di Storia Naturale, Torino, Italy and Department of Systematic Zoology and Zoogeography, Wrocław University, Wrocław, Poland).

Paraselenis (Spaethiechoma) filia (SPAETH, 1907) **bona species**

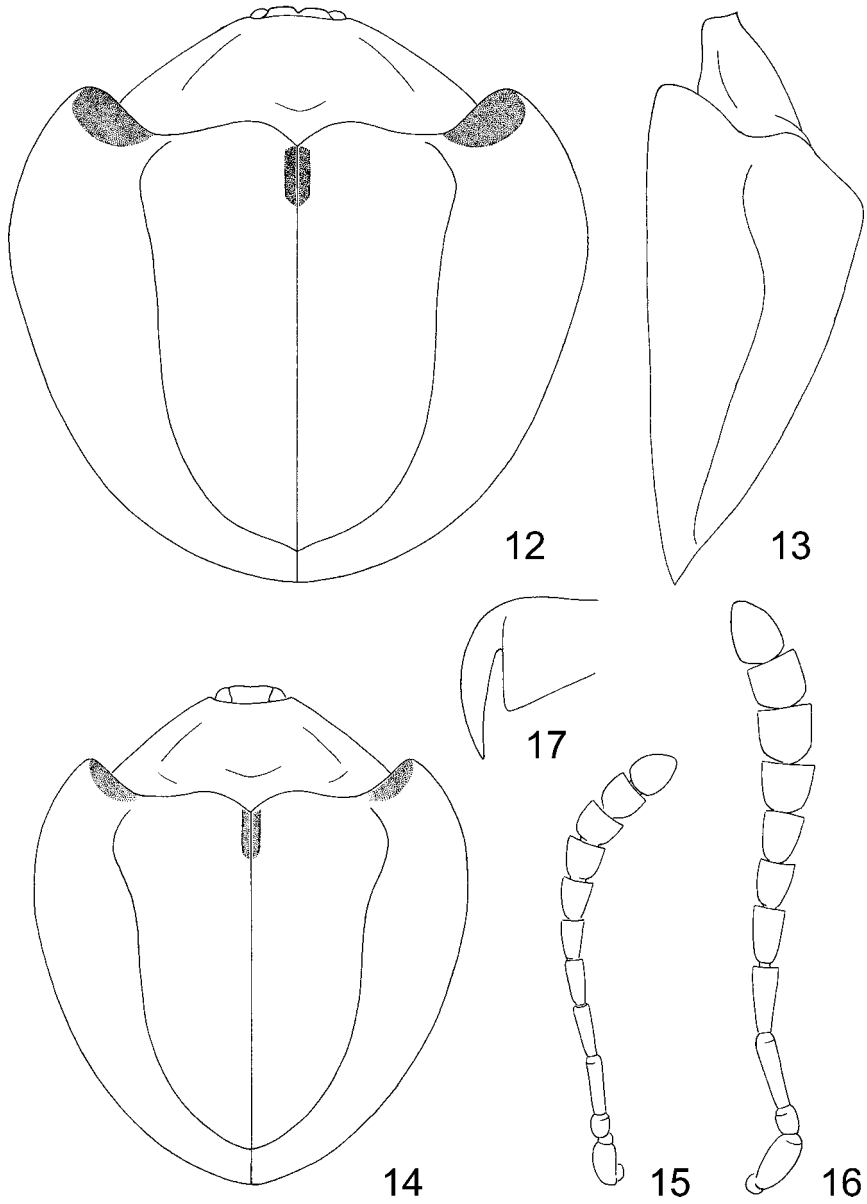

Omoplata filia SPAETH, 1907: 158 (HT! in MM!).

Echoma hyalina ab. *filia*: SPAETH, 1914 g: 53; BLACKWELDER, 1946: 743.

SPAETH (1907) described *Omoplata filia* based on single male labelled generally "Brasilia". In his world catalogue of Cassidinae (SPAETH 1914) he reduced *O. filia* to an aberration of *Paraselenis* (= *Echoma* sensu SPAETH) *hyalina* (BOHEMAN, 1854). I have examined the holotype of *P. filia* preserved at the Manchester Museum and a series of specimens from the Bruxelles Museum conspecific with the holotype and, in my opinion, they represent a good species close to *P. hyalina*. Its redescription is given below.

DIAGNOSIS

P. filia belongs to the group of species with pronotum and elytra of the same colour and base of elytra strongly wider than pronotum. The group comprises also *P. flava* (L.), *P. generosa* (BOH.), *P. hyalina* (BOH.), *P. jugata* (BOH.), *P. multisinuata* (SP.), *P. saltaensis* n. sp., *P. solieri* (BOH.), *P. suspecta* (SP.) **new status**, and *P. tersa* (BOH.). Only *P. hyalina*, *P. multisinuata* and *P. filia* have antennae uniformly yellowish brown, the remaining species have antennae uniformly black or bicolours, yellowish basally and black distally. *P. multisinuata* differs dis-

12-17. *Paraselenis filia*: 12 – male dorsal, 13 – male lateral, 14 – female dorsal, 15 – female antenna, 16 – male antenna, 17 – claw

tinctly in multisinuate elytral margin. *P. hyalina* is very similar to *P. filia* but differs in elytral disc slightly less angulate in profile and usually absent postscutellar spot, or the spot is very narrow, only slightly extending behind sutural margin (in *P. filia* reddish postscutellar spot is distinct, distinctly extending behind sutural margin); humeral angles in males of *P. hyalina* are narrower and sharply angulate while in *P. filia* they are broad and obtuse; humeral spot in males of *P. hyalina* is very narrow, sometimes absent, distinctly narrower than width of 10th antennal segment, while in *P. filia* humeral spots are broad, as wide as to slightly wider than 10th antennal segment.

DESCRIPTION

Length: male 9.4-10.5 mm, female 8.8-10.1 mm, width: male 9.35-10.3 mm female 8.1-9.0 mm, length of pronotum: male 2.7-3.0 mm female 2.45-2.8 mm, width of pronotum: male 5.55-6.4 mm female 5.2-5.95 mm, length/width ratio: male 1.02-1.07 female 1.09-1.14, width/length of pronotum ratio: male 2.06-2.21 female 2.04-2.14. Body subtriangular, strongly dimorphic. Males distinctly larger than females (mean length: male 9.98 mm, female 9.4 mm, n = 10 for both sexes), with very broad elytral marginalia, more rounded on sides than in females, with humeral angles strongly protruding anterad (figs 12, 14). Antennae in male distinctly longer and more explanate distally than in female.

Pronotum yellow, basal margin reddish. Elytra yellow, the same colour as pronotum, basal margin narrowly black, suture between scutellum and top of elytral angulation with narrow, reddish spot distinctly extending behind sutural margin. Humeral part of explanate margin in male with broad reddish spot, in female immaculate or with narrow reddish spot. No apical, sutural spot. Head, ventrites, legs and antennae uniformly rusty yellow to rusty brown.

Pronotum regularly trapezoidal, anterior and posterior angles well defined, sides straight or slightly concave, anterior margin shallowly emarginate, head visible from above. Disc moderately convex, in the middle usually with very fine and short median sulcus and moderately coarse, sparse, very shallow puncturation, in male usually better perceptible than in female. Surface of disc in male distinctly opaque, in female usually less opaque or slightly shiny, especially on the top of disc. Explanate margin distinctly opaque in both sexes, in male sparsely, very shallowly punctate, in female appears impunctate.

Scutellum very small but perceptible. Basal crenulation of elytra finer than in *P. saltaensis*. Humeral part of marginalia in male very broad, humeri strongly protruding anterad but anterior margin of humerus between humeral callus and humeral angle almost straight or slightly convex, humeral angles rounded. Sides of elytra in male slightly unevenly convex, elytra broadest in 1/4 its length then sides distinctly converging posterad. In female marginalia distinctly narrower than in male, humeri in large specimens softly, in small specimens very slightly protruding anterad, rounded, sides of elytra more regularly rounded than in male. Elytral disc angulate in profile (fig. 13). Puncturation completely irregular, moderately

coarse but dense, distance between punctures from as wide as to slightly wider than puncture diameter. Puncturation of explanate slightly coarser but sparser than on disc, especially area behind humerus sparsely punctate. In some specimens puncturation of both disc and elytra very dense, with distance between punctures slightly narrower than puncture diameter, then surface of lateral part of disc and surface of marginalia appear slightly irregular. Integuments of disc usually slightly shiny or, in males, on sides and slope slightly opaque; integument of marginalia in male usually slightly opaque, in female slightly shiny. Apex of elytral epipleura glabrous.

Ventrites with no diagnostic characters. Antennae typical for the genus *Paraselenis*, strongly sexually dimorphic. Distal segments in both sexes depressed, in male antennae distinctly longer than in female, segments 6-11 broad, on ventral sides with dense, felt hairs. Length ratio of antennal segments: male 100:50:133:117:100:83:90:83:95:83:115 (fig. 16), female 100:45:130:110:100:80:80:75:70:75:100 (fig. 15). Claws with large basal tooth (fig. 17).

MATERIAL EXAMINED

ARGENTINA: Buenos Ayres, 1 (LB).

PARAGUAY: Central Prov., Asuncion, XII 1936, 5, (IRSN, LB); Puerto Elisa, 1 (LB); Rio Paraguay, San Antonio, 8 X 1936, 1, XI 1936, 6 (IRSN, LB); San Antonio, XII 1936, 10 (IRSN, LB).

COMMENTS

SPAETH (1907) described *P. hyalina* ssp. *suspecta* from Uruguay: Montevideo. I have examined syntypes preserved at the Genova museum and in my opinion they represent a good species very close to *P. hyalina*. Both are well distinguished by antennae colouration: uniformly yellow in *P. hyalina*, and bicolour in *P. suspecta*, yellowish basally and black distally.

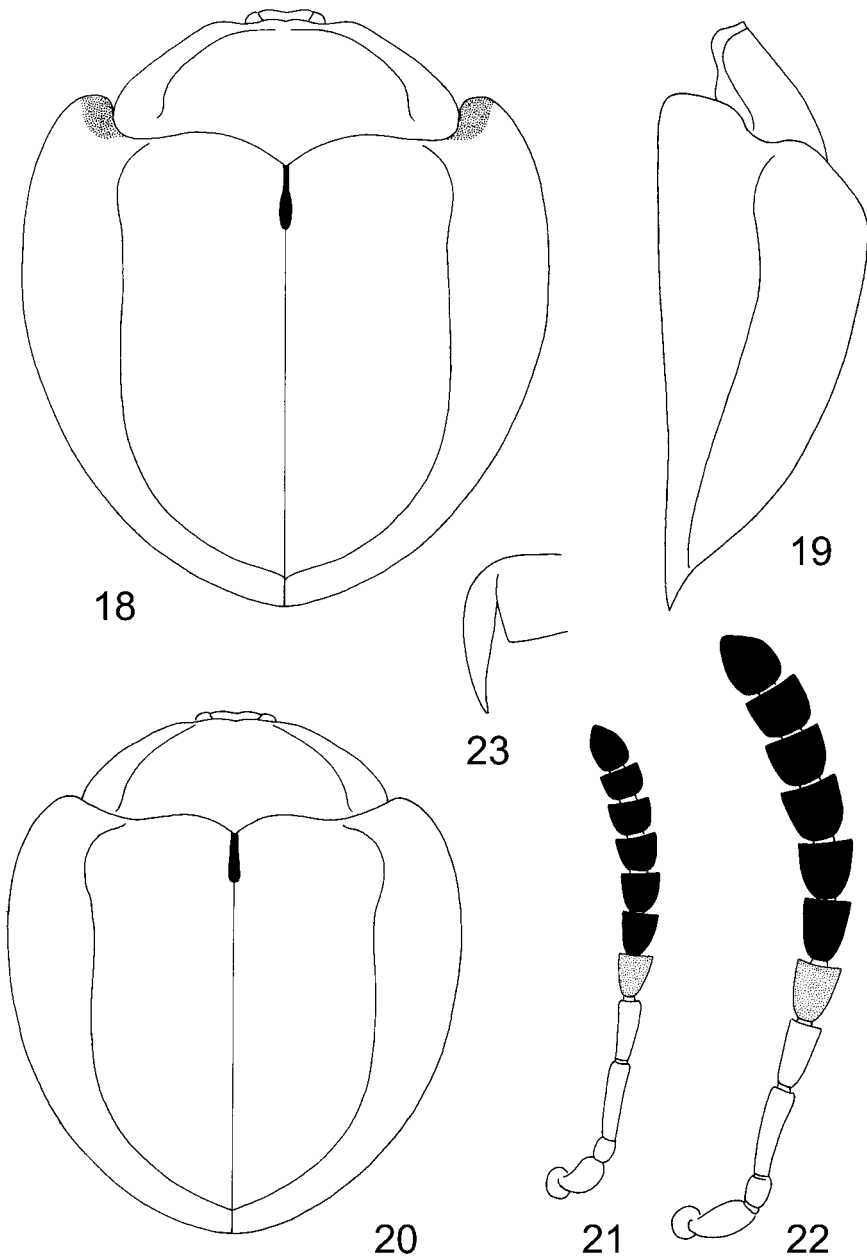

Paraselenis (Spaethiechoma) saltaensis n. sp.

ETYMOLOGY

Named after Salta province in Argentina, where part of specimens were collected.

DIAGNOSIS

P. saltaensis belongs to the group of species with pronotum and elytra of the same colour and base of elytra much wider than pronotum. The group comprises also *P. filia* (Sp.), *P. flava* (L.), *P. generosa* (Boh.), *P. hyalina* (Boh.), *P. jugata* (Boh.), *P. multisinuata* (Sp.), *P. solieri* (Boh.), *P. suspecta* (Sp.), and *P. tersa* (Boh.). *P. hyalina*, *P. multisinuata* and *P. filia* differ distinctly in

18-23. *Paraselenis saltaensis*: 18 – male dorsal, 19 – male lateral, 20 – female dorsal, 21 – female antenna, 22 – male antenna, 23 – claw

uniformly yellowish brown, and *P. generosa* in uniformly black antennae. *P. tersa* differs in broad reddish postscutellar and sutural spots (in *P. saltaensis* sutural spot absent and postscutellar spot, if present, is small and black). *P. solieri* differs in larger size, more angulate in profile elytral disc, and especially in very broad body, with length/width ratio in both sexes below 1.1. *P. suspecta* and *P. flava* are the most similar. *P. saltaensis* differs from *P. flava* in larger size, and especially in more distinct sexual dimorphism. Male humeri in *P. saltaensis* are strongly protruding anterad with broadly reddish anterior margin of marginalia, while in *P. flava* humeri are only slightly protruding anterad and anterior margin of marginalia is only narrowly marked with red or without markings. Postscutellar black spot in *P. flava* is larger than in *P. saltaensis*, often circular, distinctly extending behind sutural margin, while in *P. saltaensis* the spot is linear, usually not or only slightly extending behind sutural margin. *P. suspecta* is similarly coloured but differs in narrow, sharply angulate male humeri, with inner margin of humerus straight, while in *P. saltaensis* male humeri are very broad, obtuse, with inner margin of humerus forms distinct angle.

DESCRIPTION

Length: male 10.0-11.5 mm, female 10.2-11.2 mm, width: male 8.65-10.0 mm female 8.55-9.6 mm, length of pronotum: male 3.0-3.2 mm female 2.9-3.1 mm, width of pronotum: male 5.85-6.5 mm female 5.6-6.1 mm, length/width ratio: male 1.10-1.16 female 1.17-1.20, width/length of pronotum ratio: male 1.87-2.03, female 1.93-1.97. Body subtriangular, strongly dimorphic. Males slightly larger than females (mean length: male 10.74 mm, female 10.54 mm, $n = 30$ for both sexes), with very broad elytral marginalia, more rounded on sides than in females, with humeral angles strongly protruding anterad (figs 18, 20). Antennae in male distinctly longer and more explanate distally than in female.

Pronotum yellow, basal margin narrowly black. Elytra yellow, the same colour as pronotum, basal margin narrowly black, suture between scutellum and top of elytral angulation in most specimens narrowly black, the marking not or only slightly extending behind sutural margin. In some specimens sutural spot absent. Humeral part of explanate margin in male with narrow reddish spot, in female immaculate. In small males, the reddish spot is sometimes very narrow, runs only along anterior margin of marginalia. Head rusty yellow to rusty brown. Ventrites vary from mostly rusty brown, with only middle of prosternum and abdomen brownish-black, to mostly brownish-black with only lateral plates of thorax and sides of abdomen rusty brown. Legs rusty brown. Antennal segments 1-3 rusty yellow, segments 6-10 black, segments 4 and 5 from mostly rusty yellow to completely black.

Pronotum trapezoidal, anterior and posterior angles less defined than in the preceding species, especially sides before basal angles slightly rounded, in the middle and anteriorly sides straight or, especially in female, slightly convex, only occasionally slightly concave, anterior margin shallowly emarginate, head visible

from above. Disc moderately convex, but slightly more convex than in *P. filia*, in the middle usually with very fine and short median sulcus. Puncturation of disc fine, distinctly smaller and sparser than in *P. filia*, in male usually better perceptible than in female, in some females disc appears impunctate. Surface of top of disc in both sexes shiny, sides of disc opaque, in some females almost whole disc shiny. Explanate margin distinctly opaque in both sexes, in both sexes sparsely, very shallowly punctate, in some specimens appears impunctate.

Scutellum very small but perceptible. Basal crenulation of elytra large, larger than in *P. filia*. Humeral part of marginalia in male very broad, humeri strongly protruding anterad, anterior margin of humerus between humeral callus and humeral angle forms distinct angle, humeral angles rounded. Sides of elytra in male sevenly convex, elytra broadest in 1/3 its length then sides regularly converging posterad. In female marginalia distinctly narrower than in male, humeri not or very slightly protruding anterad, rounded, sides of elytra as regularly rounded as in male. Elytral disc softly angulate in profile (fig. 19). Puncturation completely irregular, moderately coarse but dense, distance between punctures from slightly narrower to slightly wider than puncture diameter, appears slightly more dense than in most specimens of *P. filia*. Puncturation of explanate margin only slightly coarser and sparser than on disc, on whole surface of marginalia disposed regularly with no sparsely punctate areas. Integuments of disc and marginalia in both sexes slightly shiny, beetles appear generally more shiny than *P. filia* and related species of *P. hyalina* group. Apex of elytral epipleura glabrous.

Ventrites with no diagnostic characters. Antennae typical for the genus *Paraselenis*, strongly sexually dimorphic. Distal segments in both sexes depressed, in male antennae distinctly longer than in female, segments 6-11 broad (slightly broader than in *P. filia*, especially segment 6), on ventral sides with dense, felt hairs. Length ratio of antennal segments: male 100:45:158:108:100:104:96:92:83:83:116 (fig. 22), female 100:45:160:125:85:80:75:70:65:60:100 (fig. 21). Claws with large basal tooth (fig. 23).

TYPE MATERIAL

ARGENTINA: holotype: "Argentina: Rio Salado, Chaco de Santiago dell. Estero – coll. E. Wagner"; 91 paratypes" the same data; paratype: "P. Nac. Finca, El Rey, 800 m, Pr. Salta: ARGENT., BORDÓN 21 II 1984" 2 paratypes: "SALTA, ARG., BORDÓN 1-17 II 1984" "Campo Quijano, 1600 m", paratype: "Ruta 9. La Cornisa, m. 1300, Pcia. Salta" "ARG. BORDÓN leg., 18 IV 1972".

PARAGUAY: paratype: "Estancia Postillon, Puerto Maxa, Rio Paraguay, N.-Paraguay" "Louis Des Arts jr. leg., ded. 9.III.1905."; paratype: "Paraguay: Transchaco km 320, 15 V 1984, L. Baert-J.P. Maelfait" (holotype preserved at the Instytut Royal des Sciences Naturelles de Belgique, Bruxelles, Belgium, paratypes at the Instytut Royal des Sciences Naturelles de Belgique, Bruxelles, Belgium, Department of Systematic Zoology and Zoogeography, Wrocław University, Wrocław, Poland, Manchester Museum, University of Manchester, England, and coll. D. SASSI, Castelmarte, Italy).

COMMENTS

Paraselenis jugata (BOH.) is species incertae sedis. According to the original description it is very close to or identical with *P. suspecta*. Location of types is unknown, I did not find specimens named “*jugata*” in any important European collections with BOHEMAN’s material, either in Stockholm or Berlin. Perhaps they are in the large unordered collection of Cassidinae preserved at the Paris museum (OBERTHÜR’s material), but the collection is now unavailable for studies.
